## 1. PROGRAM ABSTRACT

The KDJ11-B is a PDP-11 CPU that incorporates the J11 chip set as the heart of the processor. It is a quad height Q22 bus module. The KDJ11-B has two on-board ROM's. One of them, the 16-bit addressable ROM, contains the self-test and the boot codes. The other ROM, the 8-bit addressable one, contains the base area with hardware selection parameters, optional bootstraps, optional UFD (User Friendly Diagnostic) system description area, and optional foreign language text.

On units to be shipped to non-English speaking countries, a dummy or "null" language is loaded into the EEPROM. The purpose of this is to disable English language error messages when the system is first installed. If and when the system passes its internal self tests, the user will be instructed to run a UFD (User Friendly Diagnostics) package which will be part of a "country kit" for each separate language. The UFD package will use the local language for the particular country and, in addition, will load diagnostic and error messages in the local language into the EEPROM, so each subsequent power up or reboot will have diagnostic and error messages in the user's own language.

The purpose of this program is to load the local language into the EEPROM. If it detects an error, the program will attempt to restore the "old" language, if any and will print a message informing the user of that fact.

## 2. SYSTEM REQUIREMENTS

### Hardware Requirements

To run successfully this utility needs:

1. KDJ11-B CPU module
2. console terminal
3. at least 28K of memory

## 3. LOADING AND STARTING PROCEDURES

To start-up this program:

1. Boot XXDP+
2. Type "R NAME", where NAME is the name of the BIN or BIC file for this program.

The starting address of the program is 1000.

Note: if trying to restart the program in an arbitrary place after HALT on Break the following registers should be set up:

17777572=0 to disable memory management

17777520=1000 to clear diagnostic mode (bit 8), but still save

HALT on Break

17777746=400 to flush the cache

130  
131  
132  
133  
134  
135  
136  
137  
138  
139  
140  
141  
142  
143  
144  
145  
146 After each write, the Byte which should have been written is  
147 compared to the Byte in the proper location, and if it is not correct,  
148 the following error message is displayed:  
149  
150 EEPROM write error, PCR page n, address mmmmmmm.  
151 Data written qqq, data read rrr.  
152  
153 where n is the EEPROM page selected by the Page Control Register (PCR).  
154 mmmmmmm is the physical address of the bad byte in question, qqq is the  
155 byte value that was written out to the address and rrr what was read  
156 back in after the write. (should be identical to qqq)  
157  
158 7.2 PROCESSOR NOT KDJ11 B  
159  
160 The program checks the type of CPU it is running on, which must be a  
161 KDJ11-B processor (MFPT returns 5 in r0). If not, the following message  
162 is printed:  
163  
164 Language area not supported by this processor.  
165  
166 7.3 "OLD" BOOT ROM CODE, LANGUAGE AREA NOT SUPPORTED  
167  
168 The program checks to see if the ROM code version is 7.0 or later.  
169 Earlier versions do not support the language area in the EEPROM  
170 and would print garbage if one was loaded. The program prints the  
171 following message in that case:  
172  
173 Current Boot ROM version does not support language area.  
174  
175 In addition, the language bit in the setup area of the EEPROM is  
176 cleared, to prevent "garbage" from being printed.  
177  
178 7.4 CHECKSUM ERROR IN SETUP AREA  
179  
180 The checksum in the setup area is checked to see if it contains a valid  
181 checksum. Also, bytes 6 and 103 (addresses 17765022 and 17765314,  
182 respectively) are checked to see if they contain 0 and 252 octal,  
183 respectively. If any of these conditions is not met, the following  
184 message is printed:  
185  
186 EEPROM checksum error in setup area.

187

No attempt is made to correct a checksum error.

188

## 7.5 DIFFERENCES BETWEEN UFD "QUIET" MODE AND "STANDALONE" MODE

189

When this program is run in UFD "Quiet" mode (which will usually be the case) none of the error messages will appear. If no error is detected, no messages whatsoever are printed. If any error is detected, the program will attempt to restore the UFD and language areas to the state they were in when the program was started. If the restoration was successful, the following message is printed in the user's language:

190

191  
192  
193  
194

228  
229  
230  
231  
232

Unable to load <language>

where <language> is the name of the language. If the restoration was not successful, or there was no local language, the following message is printed.

Unable to load <language> - reverting to U.S. English

where <language> is as above. The program then clears the bit in the EEPROM setup area selecting a local language which means that the ROM English will be used from now on.

## 8. EXAMPLES . . .

After booting XXDP+ and running the program, no message should appear, just the XXDP dot prompt ( . )

If a problem occurred, one of the messages in section 7 should appear.

## 9. PROGRAM DESCRIPTION

The program consists of a body of code which loads the language into the local language area of the EEPROM. The routine that performs the write first checks the current value of the byte to be written and if it is the same, no write is performed. This is done to extend the life of the EEPROM. The write routine also checks the value in the EEPROM after the write to insure it was written correctly. After a successful run, no message appears, after an unsuccessful attempt to write any of the bytes in the EEPROM, one of the message in section 7 appears. If run under UFD "Quiet" mode, no message is printed if the program was successful, otherwise one of the messages in 7.5 appear. In both cases, the XXDP prompt appears.
